OUTPUT:

Paragraph written by AI:-

Will Ai replace jobs or change them? give a paragraph

AI is more likely to **change jobs than completely replace them.** While AI can automate repetitive and routine tasks, most jobs involve human skills such as creativity, critical thinking, emotional understanding, and decision-making, which AI cannot fully replace. Instead, AI is becoming a tool that helps people work faster and smarter—for example, assisting doctors with diagnosis, helping teachers personalize learning, or supporting engineers with data analysis. This means some roles will evolve, new jobs will be created, and workers will need to learn new skills to adapt to an AI-driven world.

Paragraph written by me:-

AI will mostly change jobs instead of fully replacing them. While some work like repetitive task can be done by AI faster, many jobs still need human thinking, creativity, and emotions which AI cannot do properly. In many fields AI is helping people do their work better, like doctors using AI for checking reports or students using AI for learning. Because of this, jobs will not disappear fully but they will change, and people will need to learn new skills to keep up with technology.

Comparison given by Ai:

Here is the **updated summary table** with the names added as you requested:

Aspect	AI-written (First Paragraph)	Hand-written (Second Paragraph)
Grammar accuracy	Very high	Moderate
Sentence complexity	Advanced	Simple
Errors	Almost none	Minor (articles, plurals)
Tone	Formal	Informal
Suitability	College / academic	School-level

If you want, I can also **rewrite the hand-written paragraph to match AI-level grammar** while keeping it natural and human-like.
